Corporate Overview

March 2025

Disclaimer

The material in this presentation regarding Tourmaline Bio, Inc. ("we," "us" or the "Company") is for informational purposes only. This presentation contains forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995 that involve substantial risks and uncertainties. All statements, other than statements of historical facts, contained in this presentation, including statements regarding the timing of initiation, progress and results of the Company's current and future preclinical and clinical trials for its product candidates, including pacibekitug (also referred to as TOUR006); the therapeutic potential of pacibekitug; the timing and likelihood of seeking regulatory approval for the Company's product candidates, including pacibekitug; the timing of submitting investigational new drug applications and other regulatory documents; the Company's ability to achieve planned milestones; the competitive landscape for the Company's product candidates; and the Company's estimates regarding expenses, future revenue, capital requirements, cash runway and needs for additional financing. The words "may," "will," "should," "expects," "intends," "plans," "anticipates," "believes," "estimates," "predicts," "potential," "continue," and similar expressions are intended to identify forward-looking statements, although not all forward-looking statements contain these identifying words. The Company may not actually achieve the plans, intentions, or expectations disclosed in these forward-looking statements, and you should not place undue reliance on these forward-looking statements. Actual results or events could differ materially from the plans, intentions and expectations disclosed in these forward-looking statements. Many factors may cause differences between current expectations and actual results, including, but not limited to, unexpected safety or efficacy data observed during preclinical or clinical studies, clinical site activation rates or clinical trial enrollment rates that are lower than expected, changes in the regulatory environment, changes in expected or existing competition, unexpected litigation or other disputes, and other risks and uncertainties, including those described in the section titled "Risk Factors" in the Company's most recent filings with the Securities and Exchange Commission. The forward-looking statements included in this presentation represent the Company's views as of the date of this presentation. The Company undertakes no obligation to update the information contained in this presentation to reflect new events or circumstances, except as required by law.

In addition, certain information contained in this presentation relates to or is based on studies, publications, surveys and other data obtained from third-party sources and the Company's own internal estimates and research. While the Company believes these third-party sources to be reliable as of the date of this presentation, it has not independently verified, and makes no representation as to the adequacy, fairness, accuracy or completeness of any information obtained from third-party sources. In addition, all of the market data included in this presentation involves a number of assumptions and limitations, and there can be no guarantee as to the accuracy or reliability of such assumptions. Finally, while we believe our own internal research is reliable, such research has not been verified by any independent source.

This presentation contains trademarks, services marks, trade names and copyrights of the Company and other companies, which are the property of their respective owners. The use or display of third parties' trademarks, service marks, trade name or products in this presentation is not intended to, and does not, imply a relationship with the Company, or an endorsement of sponsorship by the Company. Solely for convenience, the trademarks, service marks and trade names referred to in this presentation may appear without the ®, TM or SM symbols, but such references are not intended to indicate, in any way, that the Company will not assert, to the fullest extent under applicable law, their rights or the right of the applicable licensor to these trademarks, service marks and trade name.

Our mission

We are driven by our mission to develop transformative medicines that dramatically improve the lives of patients with life-altering immune and inflammatory diseases

Key highlights

An IL-6 renaissance is underway: new insights emerging about a broad range of indications where IL-6 may be clinically validated

Pacibekitug (also referred to as TOUR006) has demonstrated best-in class potential: long-acting, low immunogenicity, and low-volume subcutaneous administration observed in clinical trials to date

Two paths to significant value creation: (1) cardiovascular inflammation and (2) thyroid eye disease

A late-stage clinical company: Phase 2 TRANQUILITY trial in CV and pivotal Phase 2b spiriTED trial in TED ongoing

Two potentially transformative data readouts expected in 2025: Topline data from TRANQUILITY trial expected in Q2 2025 and topline data from spiriTED trial expected in H2 2025

Well-financed: cash expected to fund operations into H2 2027, enabling the delivery of key anticipated milestones for both paths

Pacibekitug: a long-acting anti-IL-6 monoclonal antibody with best-in-class potential

Attributes observed to date

- **Long-acting** with terminal half-life of ~7 weeks[1]
- **>90% pathway inhibition** after single 10mg dose[2]
- **Fully human** with ADAs in only 0.5% of patients[3]
- **High affinity** to IL-6[4]
- Existing data from approximately **450 study participants**[1]

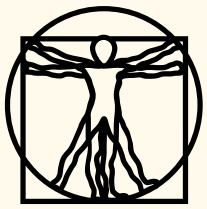
Potential value to patients

- **Dosing quarterly**[5] (CV) or **every 8 weeks**[6] (TED)
- **Rapid and robust impact** across diseases
- Durable benefit **without need to increase dose**
- Volume of ≤1ml for **SC injection**[5,6]
- Generally **well-tolerated safety profile** observed to date

TOURMALINE

[1]Across six clinical trials in healthy volunteers and RA, SLE, and CD patients. [2]Data on file; single intravenous 10mg dose in Ph1 MAD study in RA patients; as measured by C-reactive protein (CRP), a pharmacodynamic marker of IL-6 signaling. [3]Generated from Medarex transgenic mouse platform; across approximately 450 subjects dosed with pacibekitug, only 2 subjects generated anti-drug antibodies (ADAs) following treatment. [4]Data on file. [5]To be evaluated in CV Phase 2 trial. [6]To be evaluated in TED Phase 2 trial. Every 8-week dosing was achieved in prior Phase 2 trials. CD: Crohn's Disease. CV: cardiovascular. SC: subcutaneous. RA: rheumatoid arthritis. SLE: systemic lupus erythematosus. TED: thyroid eye disease.

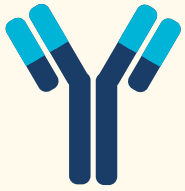
Two paths to unlock major value creation



IL-6 Renaissance

Emerging insights implicating IL-6 in a wide range of rare & large diseases

+



Pacibekitug

- ✓ Long-acting
- ✓ Low immunogenicity
- ✓ Low volume, SC

Key expected readouts

Cardiovascular Inflammation

- ❑ **Q2 2025:** TRANQUILITY Phase 2 topline data
- ➢ **2025 / 2026:** Zilti ASCVD in CKD Phase 3 (ZEUS) topline data
- ➢ **2026 / 2027:** Zilti AMI Phase 3 (ARTEMIS) topline data

Thyroid Eye Disease

- ❑ **H2 2025:** spiriTED Phase 2b topline data
- ➢ **2026:** Satra TED Phase 3 (Satra-GO) topline data

Milestones key: ❑ Internal ➢ External

The timing of regulatory and clinical trial milestones are subject to change and additional discussion with the FDA
AMI: acute myocardial infarction. ASCVD: atherosclerotic cardiovascular disease. CKD: chronic kidney disease. Satra: satralizumab. TED: thyroid eye disease. Zilti: ziltivekimab

Clinical development plan for pacibekitug

Disease Focus	Indication	Preclinical / Phase 1 / Phase 2 / Phase 3	Expected key milestones
Cardiovascular inflammation	Atherosclerotic Cardiovascular Disease (ASCVD)		TRANQUILITY Phase 2 topline data expected in Q2 2025
	Abdominal aortic aneurysm (AAA)		Phase 2 PoC trial initiation expected after TRANQUILITY topline data
Autoimmune disease	Thyroid Eye Disease (TED)		spiriTED Phase 2b topline data expected in H2 2025

Note: the hatched bar represents a trial that has not yet commenced
The timing of clinical trial milestones is subject to change and additional discussion with the FDA

Cardiovascular Inflammation

Reducing inflammation: the next frontier in CV diseases

Increasing validation for IL-6 driven inflammation as a critical and modifiable risk factor driving residual cardiovascular risk

Potential of IL-6 inhibition spans a broad range of cardiovascular indications, affecting tens of millions of patients globally

Converging lines of human evidence across multiple settings support the transformative potential of IL-6 inhibition

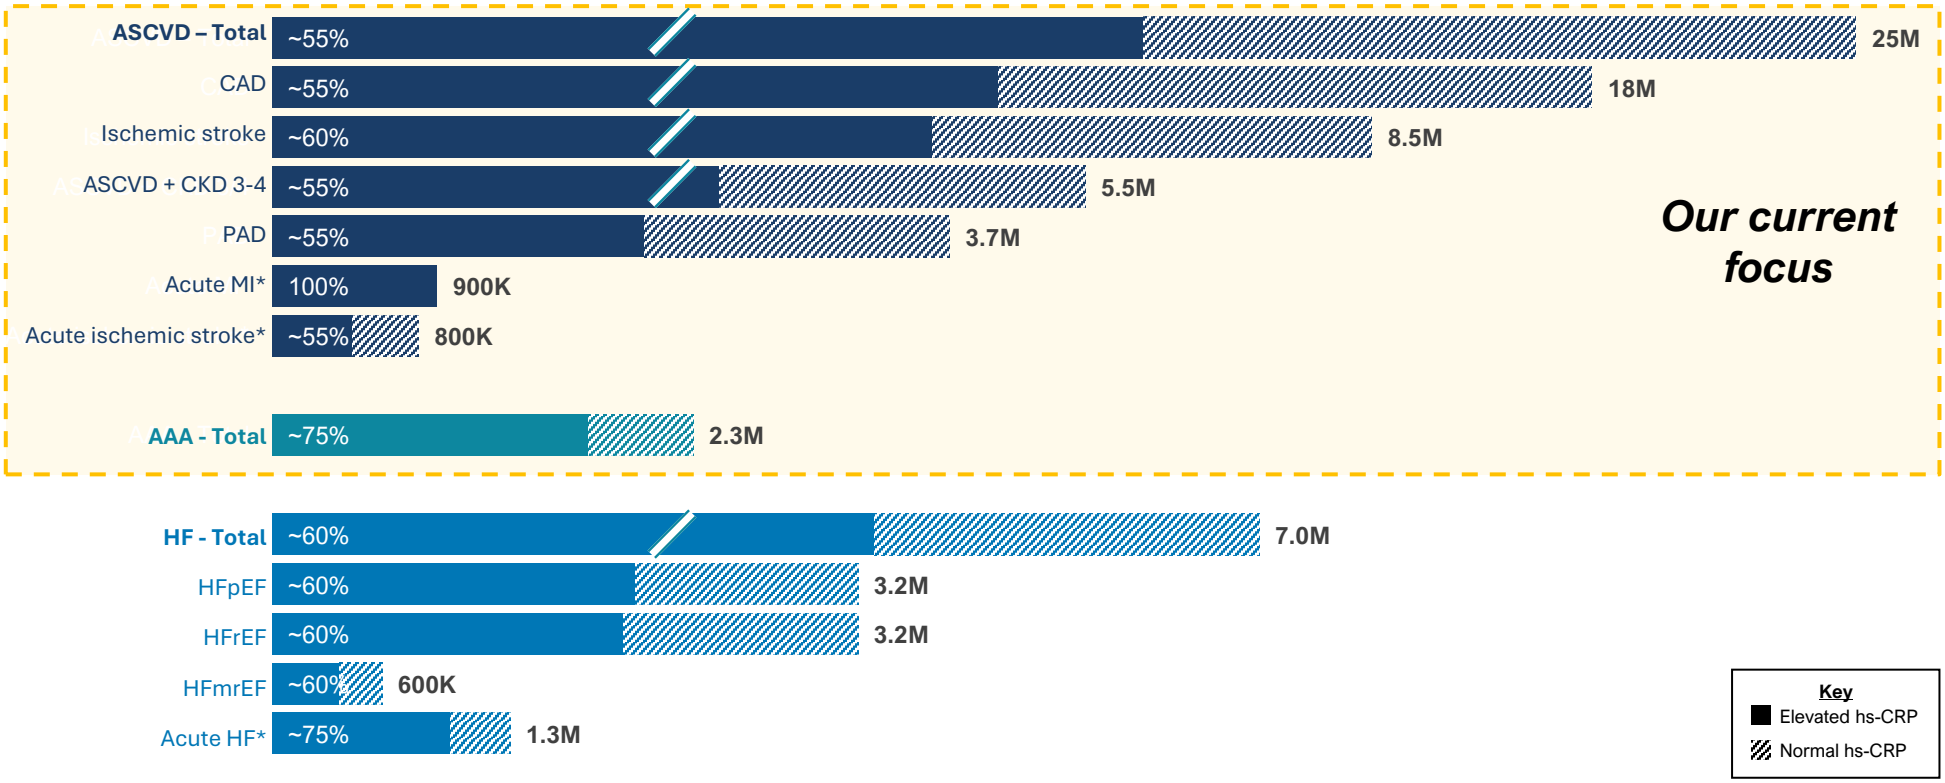
IL-6 inhibition is being evaluated in multiple cardiovascular outcomes trials with external readouts expected over the next 12 to 24 months

Pacibekitug's potentially best-in-class profile, including quarterly SC administration, is being evaluated in the Phase 2 TRANQUILITY trial – over-enrollment completed, topline data expected in Q2 2025

IL-6 inhibition has the potential to address millions of patients across a wide range of inflammation mediated CV conditions

Estimated US prevalence (2024)[1]

Populations are not mutually exclusive



[1]Publications available upon request. *Annual incidence

AAA: abdominal aortic aneurysm. ASCVD: atherosclerotic cardiovascular disease. CAD: coronary artery disease. CKD: chronic kidney disease. HF: heart failure. HFmrEF: Heart Failure with Mid-Range Ejection Fraction. HFpEF: heart failure with preserved ejection fraction. HFrEF: heart failure with reduced ejection fraction. MI: myocardial infarction. PAD: peripheral artery disease.

Cardiovascular inflammation largely unaddressed by existing treatments

Atherothrombotic Pathways	Thrombosis	Hypertension	Atherogenic lipoproteins	Diabetes, Insulin resistance, Obesity	Inflammation
					Biomarkers	**None readily available**	**Blood pressure**	**ApoB, Non-HDL-C, LDL-C, Triglycerides, Lipoprotein(a)**	**HbA1c, Fasting glucose, Weight**	**C-reactive protein**
Approved Therapies	Aspirin P2Y12R inhibitors Factor Xa inhibitors PAR-1 antagonists	ACEI/ARB Calcium channel blockers Thiazide diuretics Renin inhibitors Beta-blockers Mineralocorticoid antagonists	Statins PCSK9 inhibitors Icosapent ethyl NPC1L1 inhibitors ACL inhibitors Bile acid sequestrants MTP inhibitors ANGPTL3 inhibitors Apheresis	SGLT2 inhibitors GLP-1 agonists GIP/GLP-1 agonists	Colchicine
Therapies in Late-Stage Development	Factor XI inhibitors Factor XIa inhibitors	Angiotensinogen inhibitors Aldosterone synthase inhibitors Endothelin antagonists Renal denervation Baroreceptor activation	CETP inhibitors Lipoprotein(a) inhibitors ApoC3 inhibitors Fibrates CRISPR PCSK9 base editing	GIP/GLP-1/glucagon agonists Amylin agonists GIP-1/amylin agonists	**IL-6 inhibitors** NLRP3 inhibitors

List of therapies not exhaustive. ACEI: angiotensin-converting enzyme inhibitor. ACL: adenosine triphosphate-citrate lyase. ANGPTL3: angiopoietin-like protein 3. ApoB: apolipoprotein B. ApoC3: apolipoprotein C3. ARB: angiotensin receptor blocker. CETP: Cholesteryl ester transfer protein. CRISPR: clustered regularly interspaced short palindromic repeats. GIP: gastric inhibitory polypeptide. GLP-1: glucagon-like peptide-1. IL-6: Interleukin-6. MTP: microsomal triglyceride transfer protein. NLRP3: nucleotide-binding domain, leucine-rich–containing family, pyrin domain–containing-3. NPC1L1: Niemann-Pick C1-Like 1. PAR: protease-activated receptors. PCSK9: proprotein convertase subtilisin/ kexin type 9. P2Y12R: purinergic 2Y type 12 receptor. SGLT2: sodium-glucose cotransporter 2.

Increasing recognition of inflammation & IL-6 as drivers of CV risk

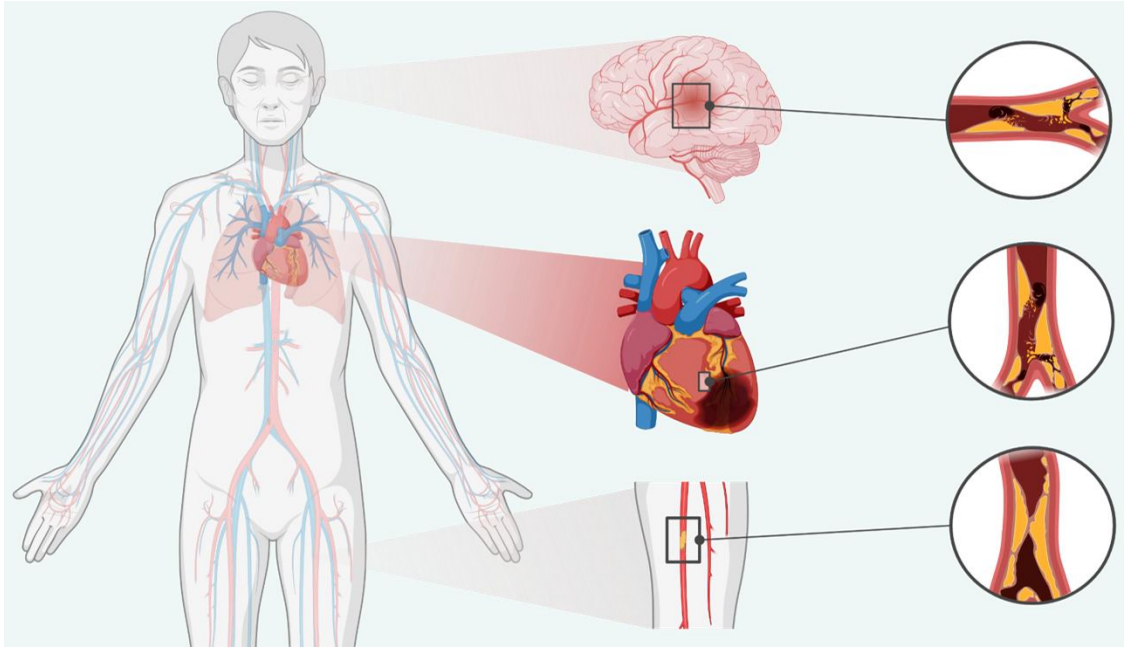
Convergence of human evidence supports therapeutic potential of IL-6 inhibition for ASCVD

- Human genetic evidence
- Epidemiological evidence
- Clinical trial evidence

Evidence suggests IL-6 may drive ASCVD risk



ASCVD: atherosclerotic cardiovascular disease

Human genetic studies provide initial support for IL-6 pathway inhibition to lower ASCVD risk

Concordance between results of human genetic studies and randomized clinical trials

Therapeutic target	Genetic Result	RCT Result
Lowering LDL-C to lower ASCVD risk[1,2]	Positive	Positive
Inhibiting IL-6 to treat polymyalgia rheumatica[3,4]	Positive	Positive
Lowering blood pressure to lower ASCVD risk[5,6]	Positive	Positive
Raising HDL-C to lower ASCVD risk[7,8]	Negative	Negative
Inhibiting LpPLA2 to lower ASCVD risk[9,10]	Negative	Negative
Lowering Lp(a) to lower ASCVD risk[11]	Positive	Trials Ongoing
Inhibiting IL-6 to lower ASCVD risk[12-16]	Positive	Trials Ongoing

"Probability of success for drug mechanisms with genetic support is 2.6 times greater than those without."[17]

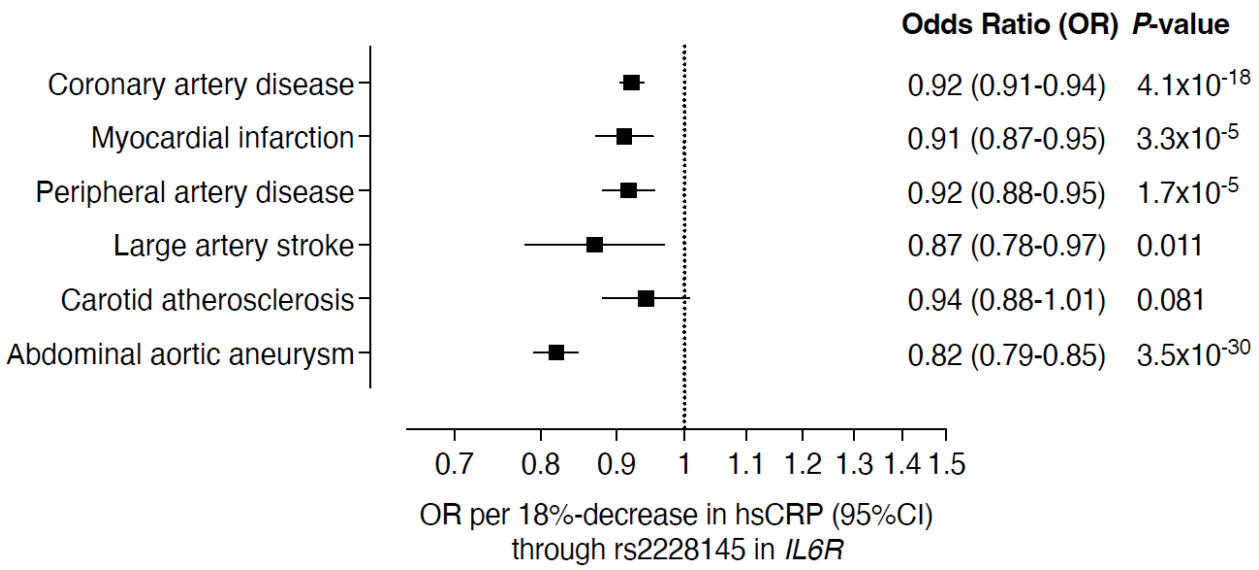
IL-6R gene variant mimicking low-dose IL-6 pharmacological blockade is consistently associated with a lower risk of ASCVD

IL-6R gene variant rs2228145 associated with lower risk of ASCVD[1]



- rs2228145 is a common functional IL-6R gene variant (p.Asp358Ala)
- Prevalence of 30-40% (Europe)[2-5]
- Increased IL-6R ectodomain splicing by ADAM10/17[2]
- Carriers of rs2228145 demonstrated concordant changes in downstream biomarkers compared with tocilizumab (↓CRP, fibrinogen;↑albumin, sIL-6R)[2-5]
- Modest reduction in hs-CRP ~9% per allele[6]

Emerging evidence suggests that hs-CRP is more strongly associated with MACE than both LDL and Lp(a)

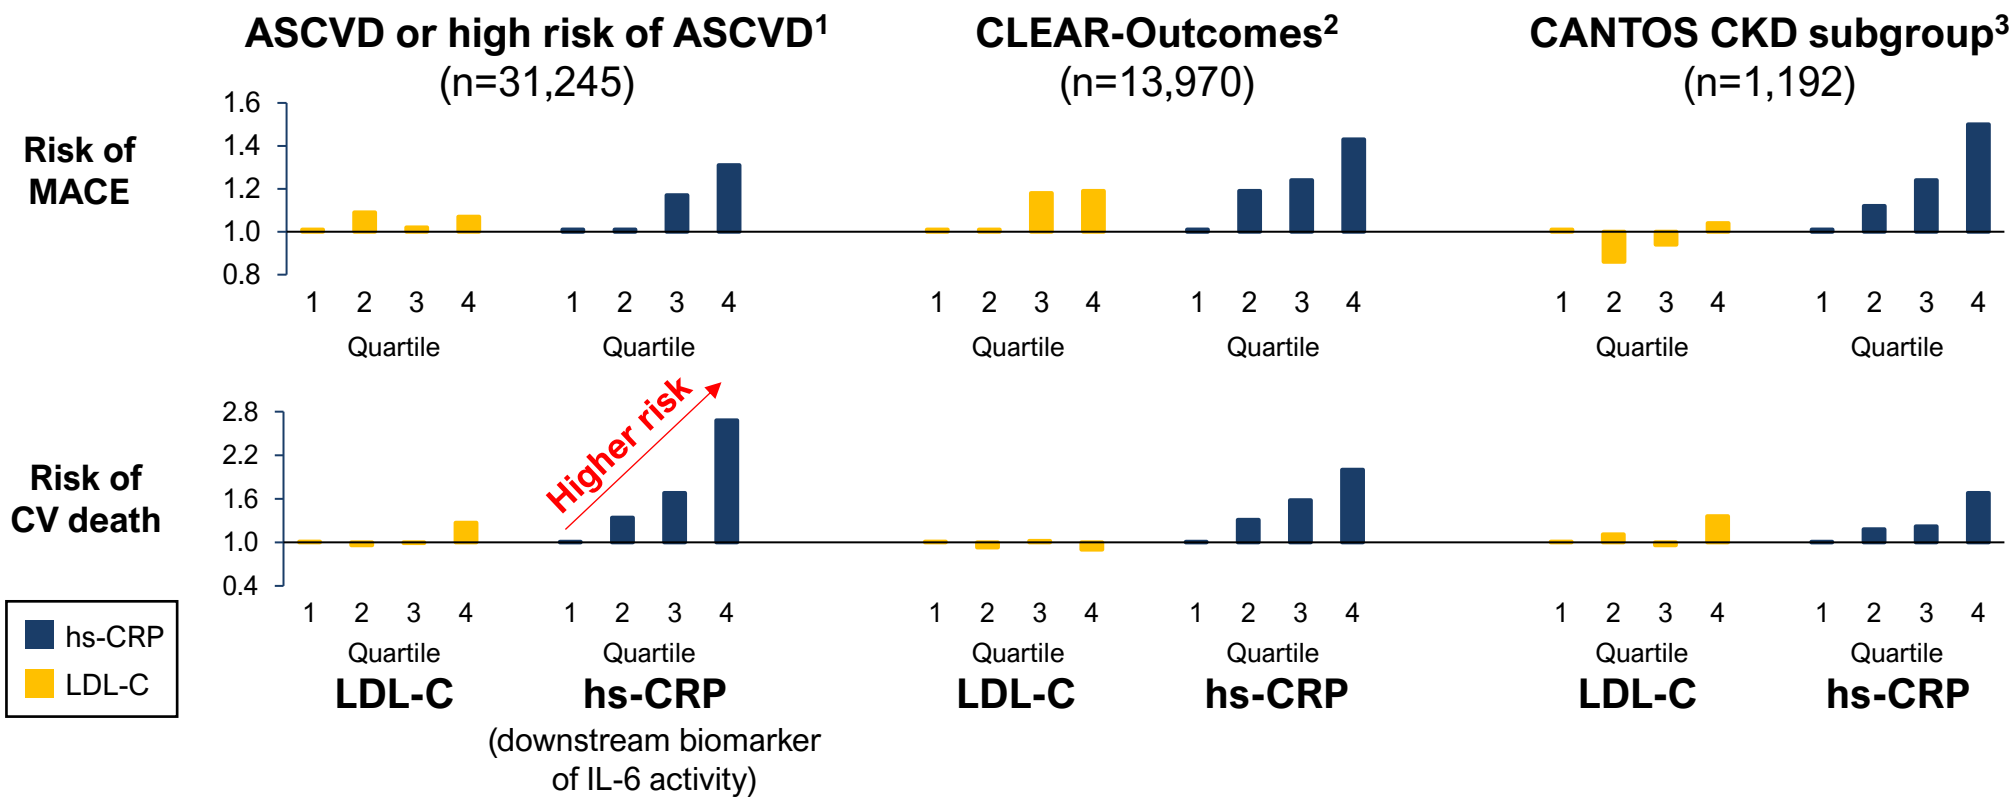
Late breaking data presented at European Society of Cardiology 2024 Congress and simultaneously published in the New England Journal of Medicine

30-year longitudinal data from the Women's Health Study[1]
(n=27,929)

	Quintile (reference)	Quintile 2	Quintile 3	Quintile 4	Quintile 5
hs-CRP mg/L baseline	<0.65	0.65 to <1.47	1.47 to <2.75	2.75 to <5.18	≥5.18
LDL-C mg/dL baseline	<96.1	96.1 to <113.5	113.5 to <129.7	129.7 to <150.7	≥150.7
Lp(a) mg/dL baseline	<3.6	3.6 to <7.6	7.6 to <15.5	15.5 to <44.1	≥44.1

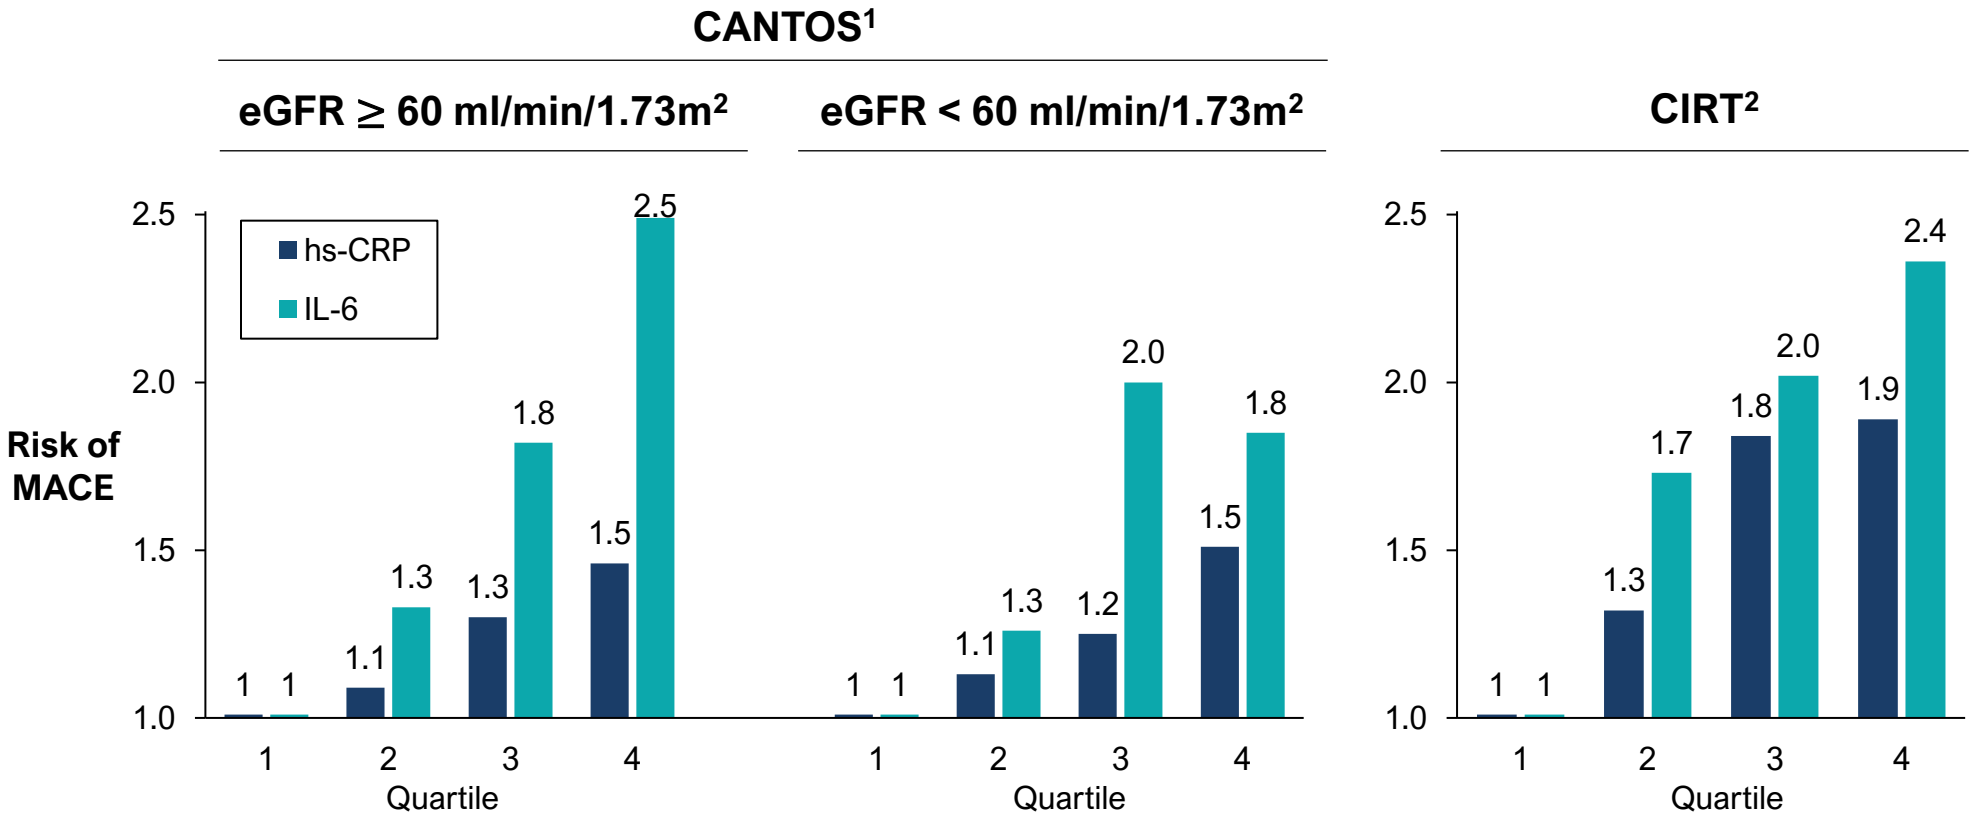
[1]Women's Health Study. MACE: CV death, MI, stroke, coronary revascularization. Increased risk defined as 1-relative risk, compared to lowest quintile of Lp(a) and hs-CRP population, adjusted for age, initial randomization treatment group, smoking (current, past, never), presence of diabetes, and Framingham blood pressure categories. Table 2. Ridker et al, NEJM (2024).

Multiple observational studies show hs-CRP levels predict future MACE even better than cholesterol in high-risk populations



Hazard ratios shown. Major adverse cardiovascular events (MACE) include myocardial infarction, stroke, coronary revascularization, cardiovascular (CV) death.
CKD: chronic kidney disease. hs-CRP: high-sensitivity C-reactive protein. LDL: low-density lipoprotein cholesterol. Certain data in this presentation are based on a cross-trial comparison and are not based on head-to-head clinical trials. Cross trial comparisons are inherently limited and may suggest misleading similarities or differences in outcomes. Results of head-to-head comparisons may differ significantly from those set forth herein.
[1]Ridker et al., Lancet (2023). [2]Ridker et al., Circulation (2023). [3]Ridker et al., Eur Heart J (2022).

Higher levels of IL-6, like hs-CRP, strongly and independently predicted MACE in large prospective studies



[1]Ridker et al, Eur Heart J (2022). CANTOS. [2]Ridker et al, Eur Heart J (2020). CIRT. Myocardial infarction or multivessel coronary disease who additionally had diabetes or metabolic syndrome. Adjusted for age, gender, smoking status, body mass index, and blood pressure and stratified on diabetes and or metabolic syndrome. Ridker et al, Circ Res (2021). Mehta et al., Curr Atheroscler Rep (2024).

Landmark CANTOS study validated therapeutic potential of addressing inflammation in ASCVD

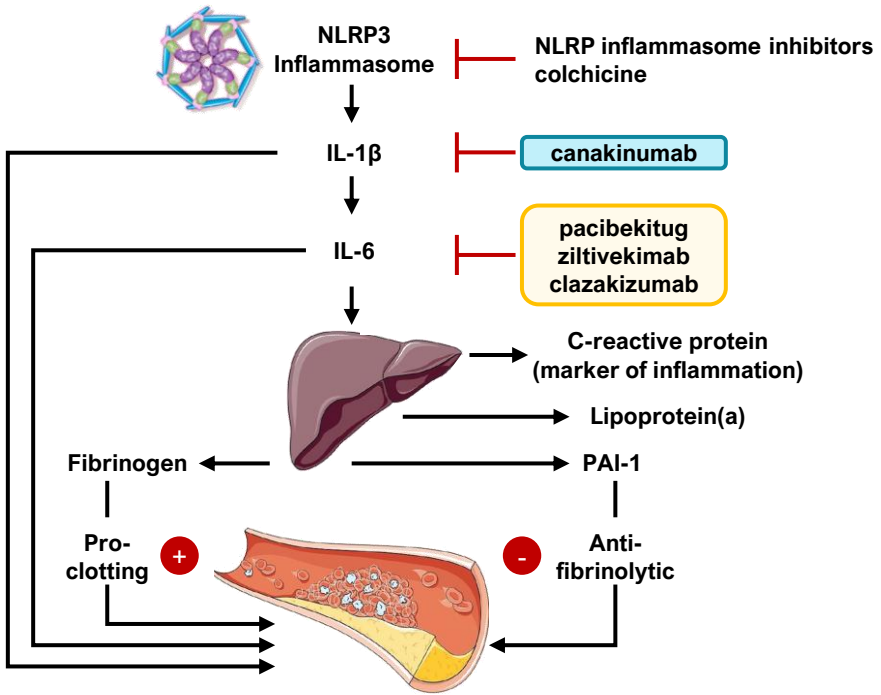
Canakinumab Anti-inflammatory Thrombosis Outcomes Study (CANTOS) Trial Design[1]

10,061 patients
- Stable CAD (post MI)
- On Statin, ACE/ARB, BB, ASA
- hs-CRP ≥2 mg/L

- Canakinumab 50 mg Q3M n = 2,170
- Canakinumab 150 mg Q3M n = 2,284
- Canakinumab 300 mg Q3M n = 2,263
- Placebo Q3M n = 3,344

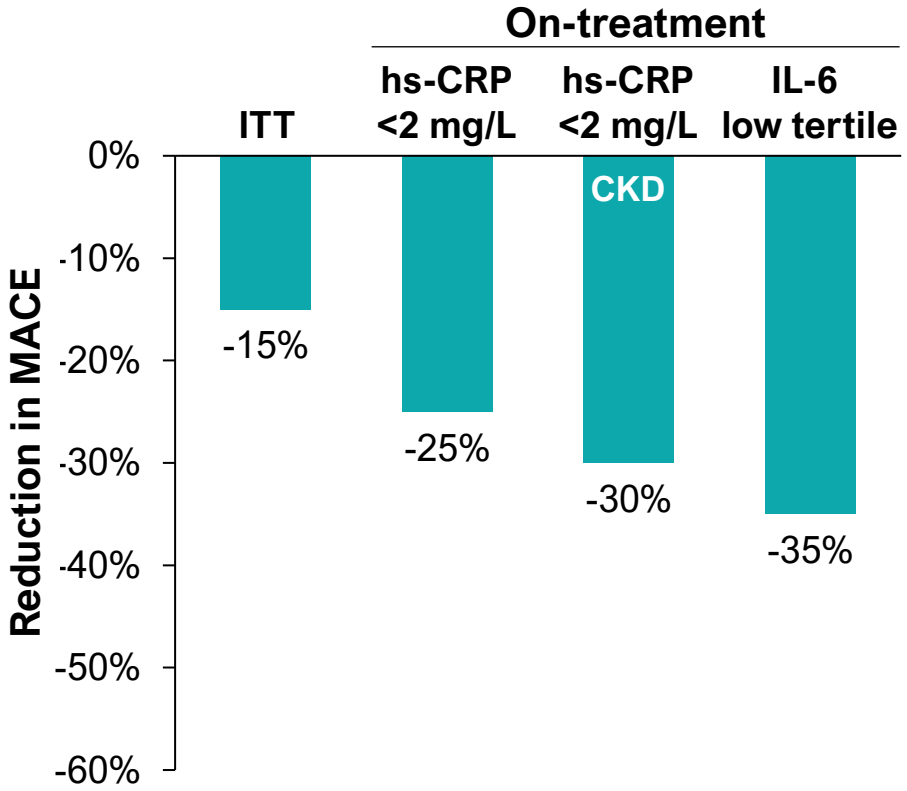
Primary endpoint:
Time to the first occurrence of MACE (CV death, non-fatal MI, or non-fatal stroke)

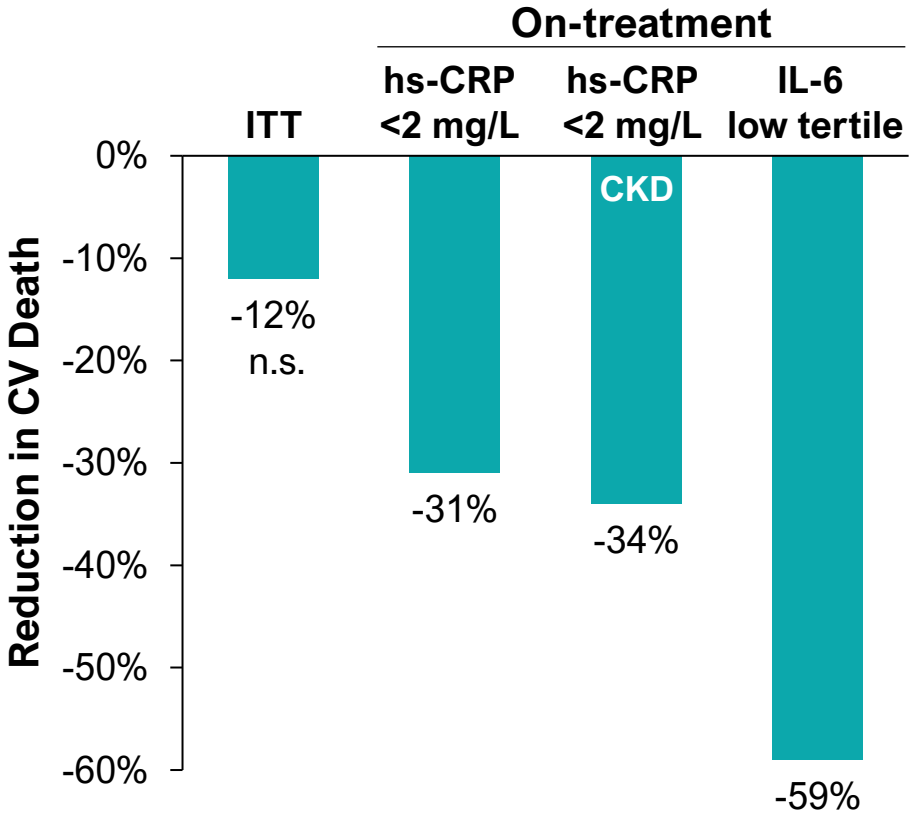
IL-1β is upstream of IL-6[2]



[1]Ridker et al., NEJM (2017). [2]Adapted from Ridker et al., Circ. Res. (2016), Arnold et al., Eur. J. Cardiol. (2021) and Muller et al., J Lipid Res (2015)

Lessons from canakinumab (anti-IL-1β mAb): Robust IL-6 pathway inhibition associated with improved outcomes

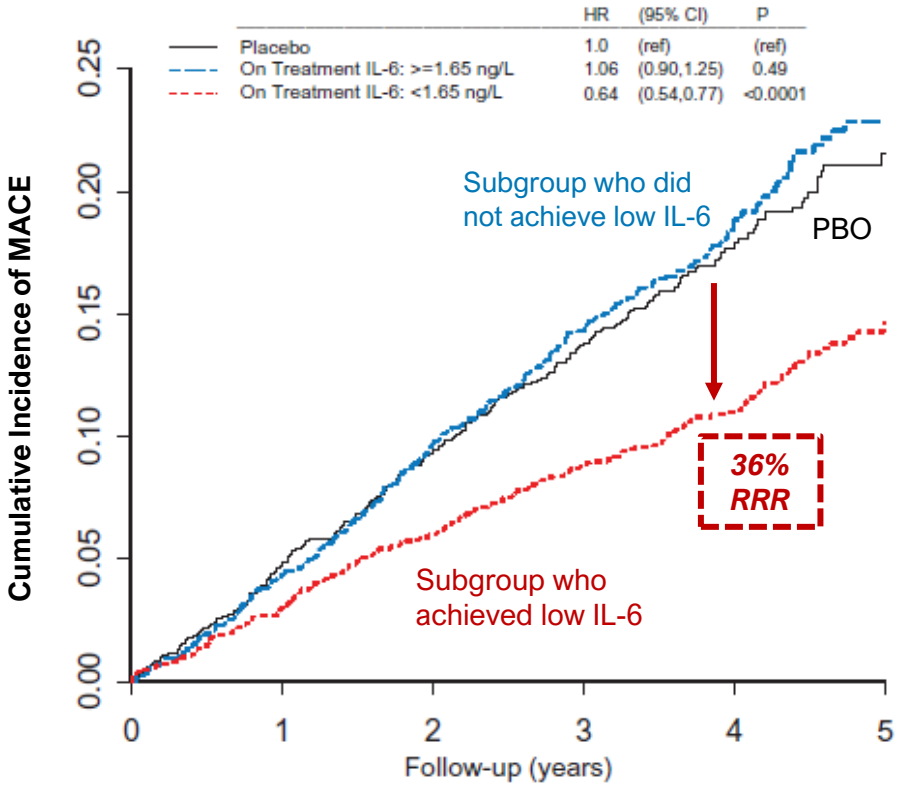


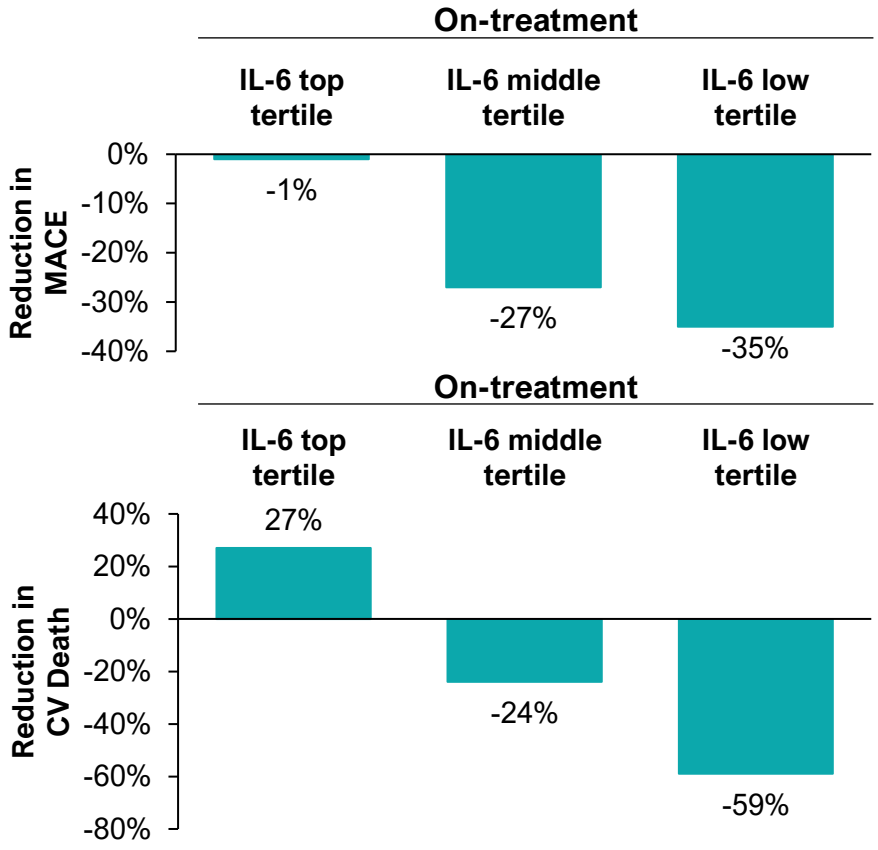


TOURMALINE

Reduction in MACE shown as 1-Hazard Ratio vs placebo. ITT: intent to treat. MACE: major adverse cardiovascular events including CV death, myocardial infarction (MI), stroke. n.s.: not statistically significant. ITT CANTOS analysis presents data for 150mg dose group; values for CANTOS subanalyses combine all doses (50, 150, 300 mg). Ridker et al., NEJM (2017). Ridker et al., Lancet (2018). Adjusted for age, gender, smoking, hypertension, diabetes, BMI, baseline hs-CRP, baseline LDL-C. Ridker et al., Eur Heart J (2018). Adjusted for age, gender, smoking, hypertension, diabetes, BMI, baseline IL-6, baseline LDL-C. Ridker et al., JACC (2018).

Lessons from canakinumab (anti-IL-1β mAb): Prespecified analysis showed that reductions in IL-6 predicted CV benefit[1-3]

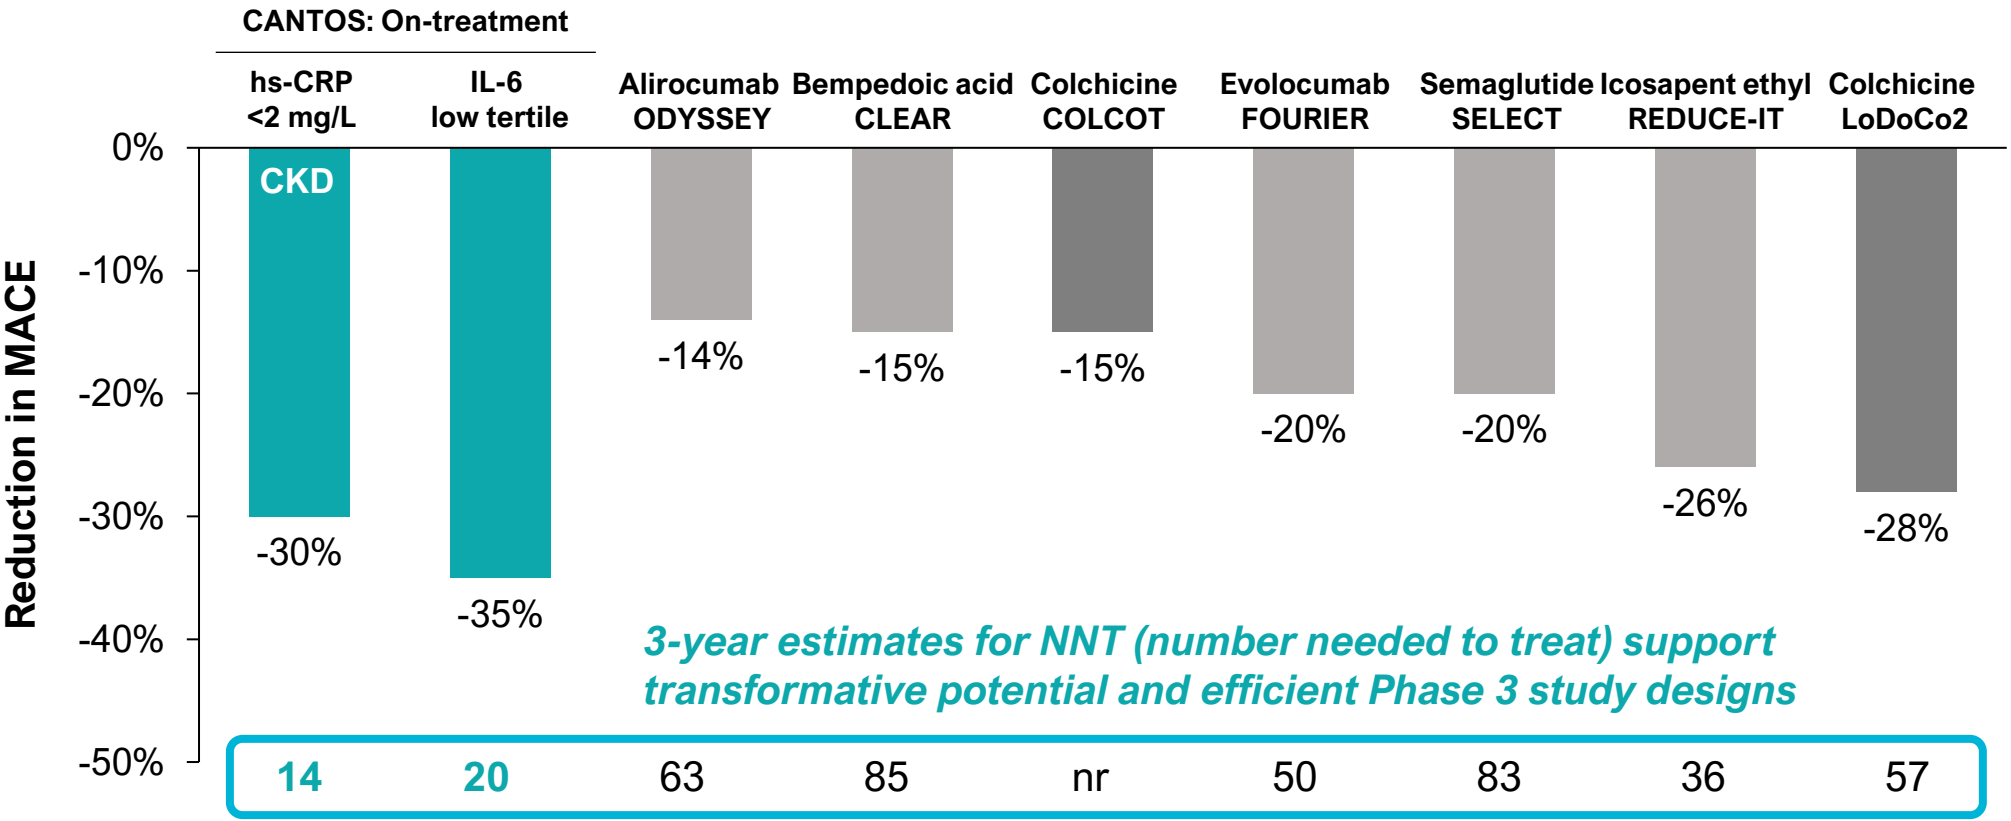




TOURMALINE

[1]Ridker et al., Eur Heart J (2018). [2]Ridker et al., Circulation (2021). [3]Libby et al., Eur Heart J (2018). Reduction in MACE shown as 1-Hazard Ratio vs placebo.
Covariates included in the adjusted multivariable model include age, gender, smoking status, hypertension, diabetes, body mass index, baseline level of IL-6, and baseline level of LDL cholesterol.

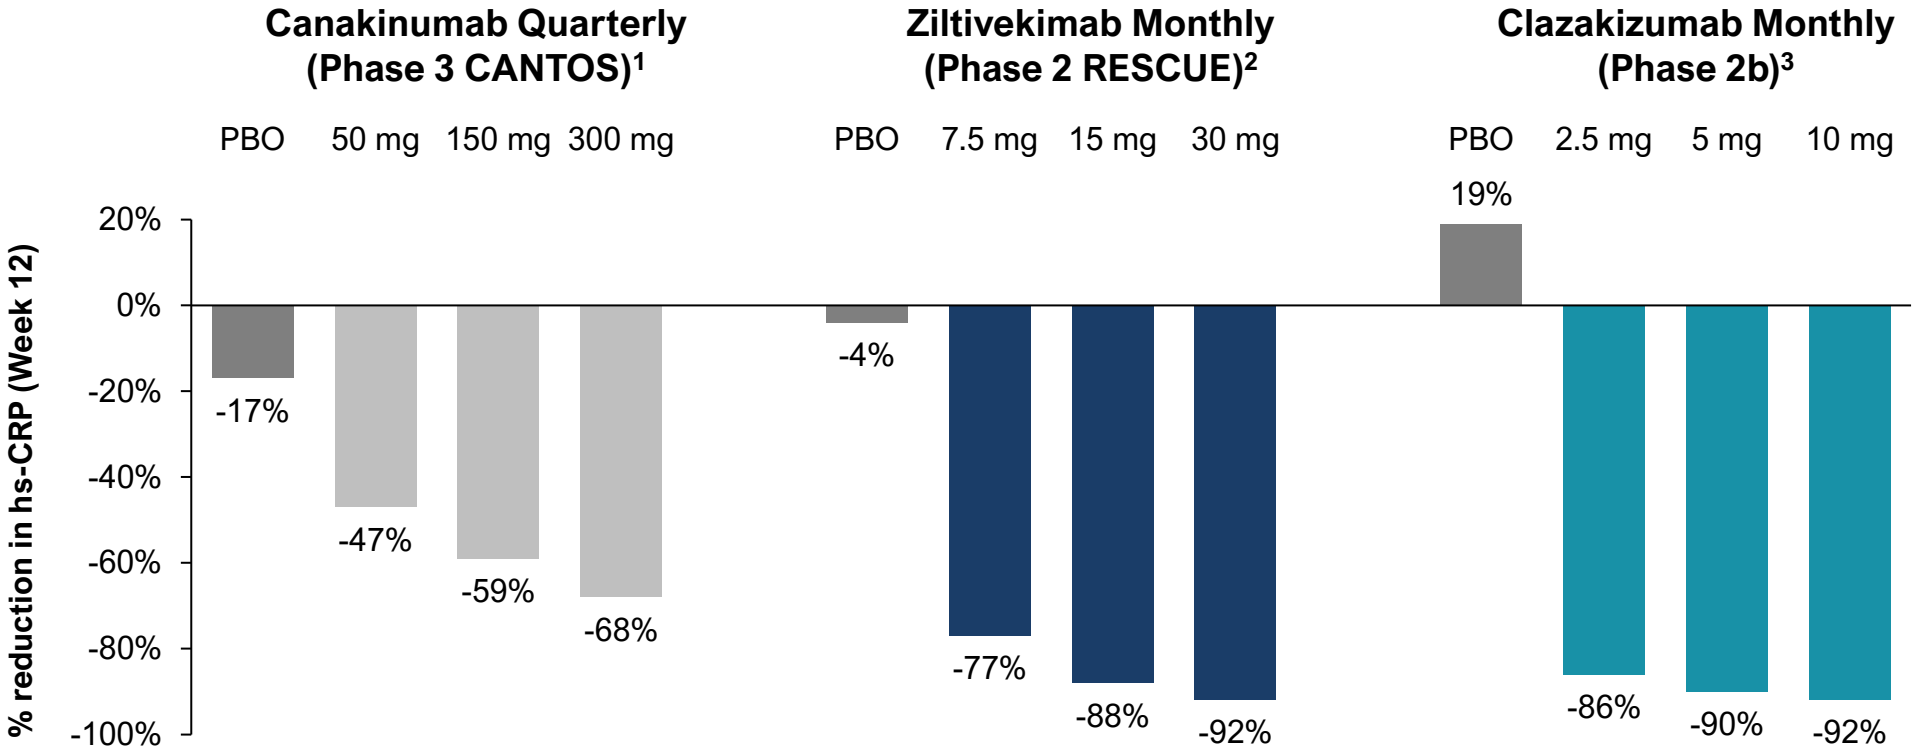
Lessons from canakinumab (anti-IL-1β mAb): Robust inhibition of IL-6 pathway has transformative potential in ASCVD



TOURMALINE

Reduction in MACE shown as 1-Hazard Ratio. MACE: major adverse cardiovascular events including CV death, myocardial infarction (MI), stroke except for: ODYSSEY OUTCOMES (all death, MI, ischemic stroke); COLCOT (CV death, MI, stroke, resuscitated cardiac arrest); LoDoCo2 (CV death, MI, ischemic stroke); main CANTOS analysis presents data for 150mg dose group; values for CANTOS subanalyses combine all doses (50, 150, 300mg); control arms were placebo + background SoC. Certain data in this slide are based on a cross-trial comparison and are not based on head-to-head clinical trials. Cross-trial comparisons are inherently limited and may suggest misleading similarities or differences in outcomes. Results of head-to-head comparisons may differ significantly from those set forth herein. NNT (number needed to treat) values obtained from absolute risk extracted from Kaplan-Meier figures via webplotdigitizer, unless directly reported. NNT for IL-6 < median shown; not reported for IL-6 low tertile. The information on this slide is based on Tourmaline-generated analysis of third-party data and is being presented for hypothesis generating purposes only. As a result, the actual MACE risk reduction hypothesized may be more or less than the data presented in this slide. Publications available upon request.

In independent studies, direct IL-6 inhibition lowered hs-CRP more than upstream IL-1β blockade

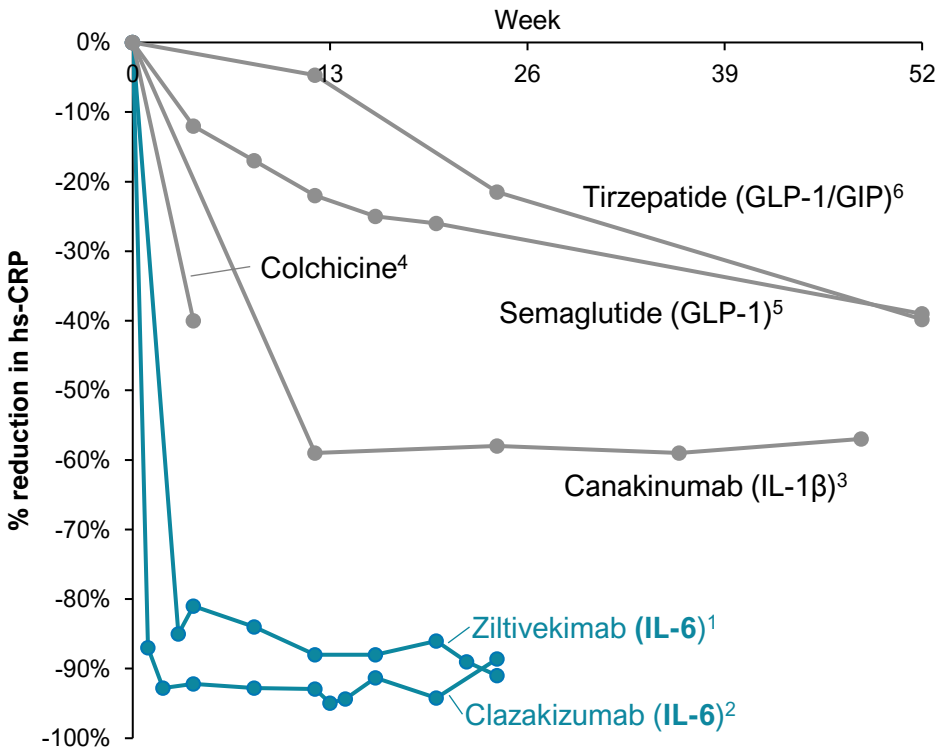


Direct IL-6 inhibition achieved ~2x placebo-adjusted reductions in hs-CRP compared to upstream IL-1β

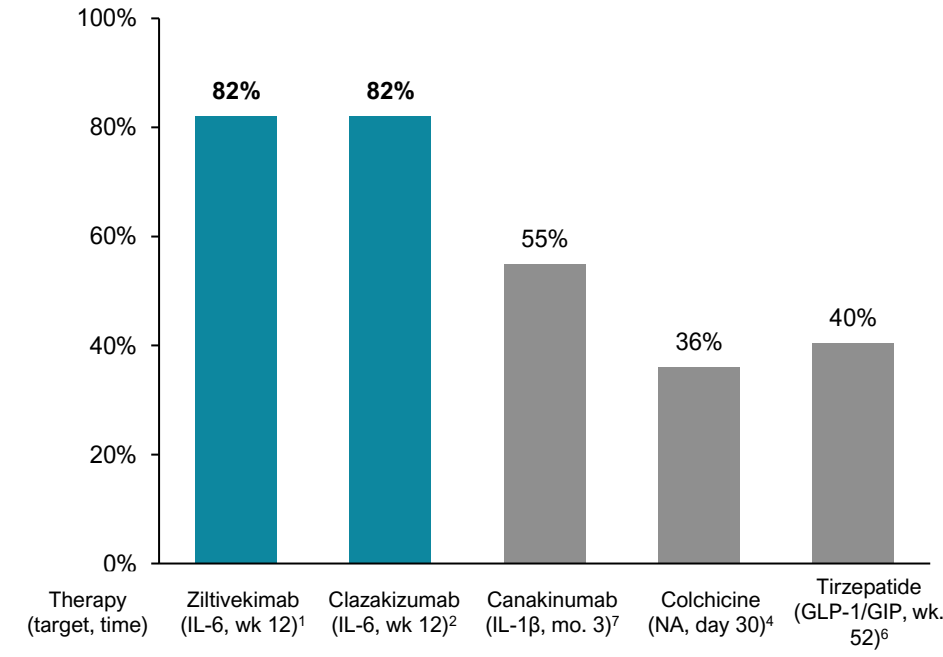
[1]Ridker et al., NEJM (2017); median reductions reported. [2]Ridker et al., Lancet (2021); median reductions reported. [3]Chertow, Nature (2024); geometric mean ratios reported. Certain data in this presentation are based on a cross-trial comparison and are not based on head-to-head clinical trials. Cross-trial comparisons are inherently limited and may suggest misleading similarities or differences in outcomes. Results of head-to-head comparisons may differ significantly from those set forth herein.

IL-6 inhibition has produced rapid and robust hs-CRP reductions in patients with established or at high-risk of CVD

Percent reduction in hs-CRP



% of patients with hs-CRP <2 mg/L



Therapy (target, time)	Ziltivekimab (IL-6, wk 12)[1]	Clazakizumab (IL-6, wk 12)[2]	Canakinumab (IL-1β, mo. 3)[7]	Colchicine (NA, day 30)[4]	Tirzepatide (GLP-1/GIP, wk. 52)[6]
Baseline hs-CRP (mg/L), median	**5.70**	**7.2**	**4.25**	**4.40**	**3.1**

TOURMALINE

[1]RESCUE: Ridker et al., Lancet (2021). Ziltivekimab 15mg q4w arm. [2]Chertow et al., Nat Med (2024). Clazakizumab 5mg q4w arm. [3]CANTOS: Ridker et al., NEJM (2017). 150mg q3m arm. [4]Fiolet et al., PLOS ONE (2020). Colchicine 0.5mg QD. [5]SELECT: Plutzky et al., EAS Congress (2024). Semaglutide 2.4mg QW maintenance. [6]Borlaug et al., Nat Med (2024). Tirzepatide up to 15mg QW. [7]Ridker et. al., Lancet (2017). Time course values obtained by webplotdigitizer. Values are not placebo adjusted. CVD: cardiovascular disease. GIP: gastric inhibitory polypeptide. GLP-1: glucagon-like peptide-1. hs-CRP: high sensitivity C-reactive protein. Certain data in this presentation are based on a cross-trial comparison and are not based on head-to-head clinical trials. Cross trial comparisons are inherently limited and may suggest misleading similarities or differences in outcomes. Results of head-to-head comparisons may differ significantly from those set forth herein.

Five Phase 3 CVOTs enrolling >24,000 patients

ZEUS: ASCVD w/CKD[1]

6,200 patients
- ASCVD
- CKD stage 3-4
- hs-CRP ≥2 mg/L

1:1

- Ziltivekimab 15 mg QM + Standard of Care
- Placebo QM + Standard of Care

Primary endpoint:
Time to the first occurrence of MACE (CV death, non-fatal MI, or non-fatal stroke)

ARTEMIS: acute MI[2]

10,000 patients
- Acute MI
- First dose within 36 or 48 hrs

1:1

- Ziltivekimab loading 30mg followed by 15mg QM + Standard of Care
- Placebo QM + Standard of Care

Primary endpoint:
Time to the first occurrence of MACE (CV death, non-fatal MI, or non-fatal stroke)

ATHENA: HFpEF[3]

680 patients
- HF Class II-III
- hs-CRP ≥2 mg/L

1:1

- Ziltivekimab QM + Standard of Care
- Placebo QM + Standard of Care

Primary endpoint:
Change in KCCQ-CSS at 1 year

HERMES: HFpEF[4]

5,600 patients
- HF Class II-IV
- hs-CRP ≥2 mg/L

1:1

- Ziltivekimab 15 mg QM + Standard of Care
- Placebo QM + Standard of Care

Primary endpoint:
Time to first occurrence of a composite HF endpoint (CV death, HF hospitalization, or urgent HF visit)

POSIBIL6: ESKD[5]

2,310 patients
- ESKD
- Diabetes or ASCVD
- hs-CRP ≥2 mg/L

1:1

- Clazakizumab 5 mg Q4W + Standard of Care
- Placebo Q4W + Standard of Care

Primary endpoint:
Time to first occurrence of CV death or MI

Topline data readouts expected

2025 / 2026	2026 / 2027	2026	2027	2029

TOURMALINE

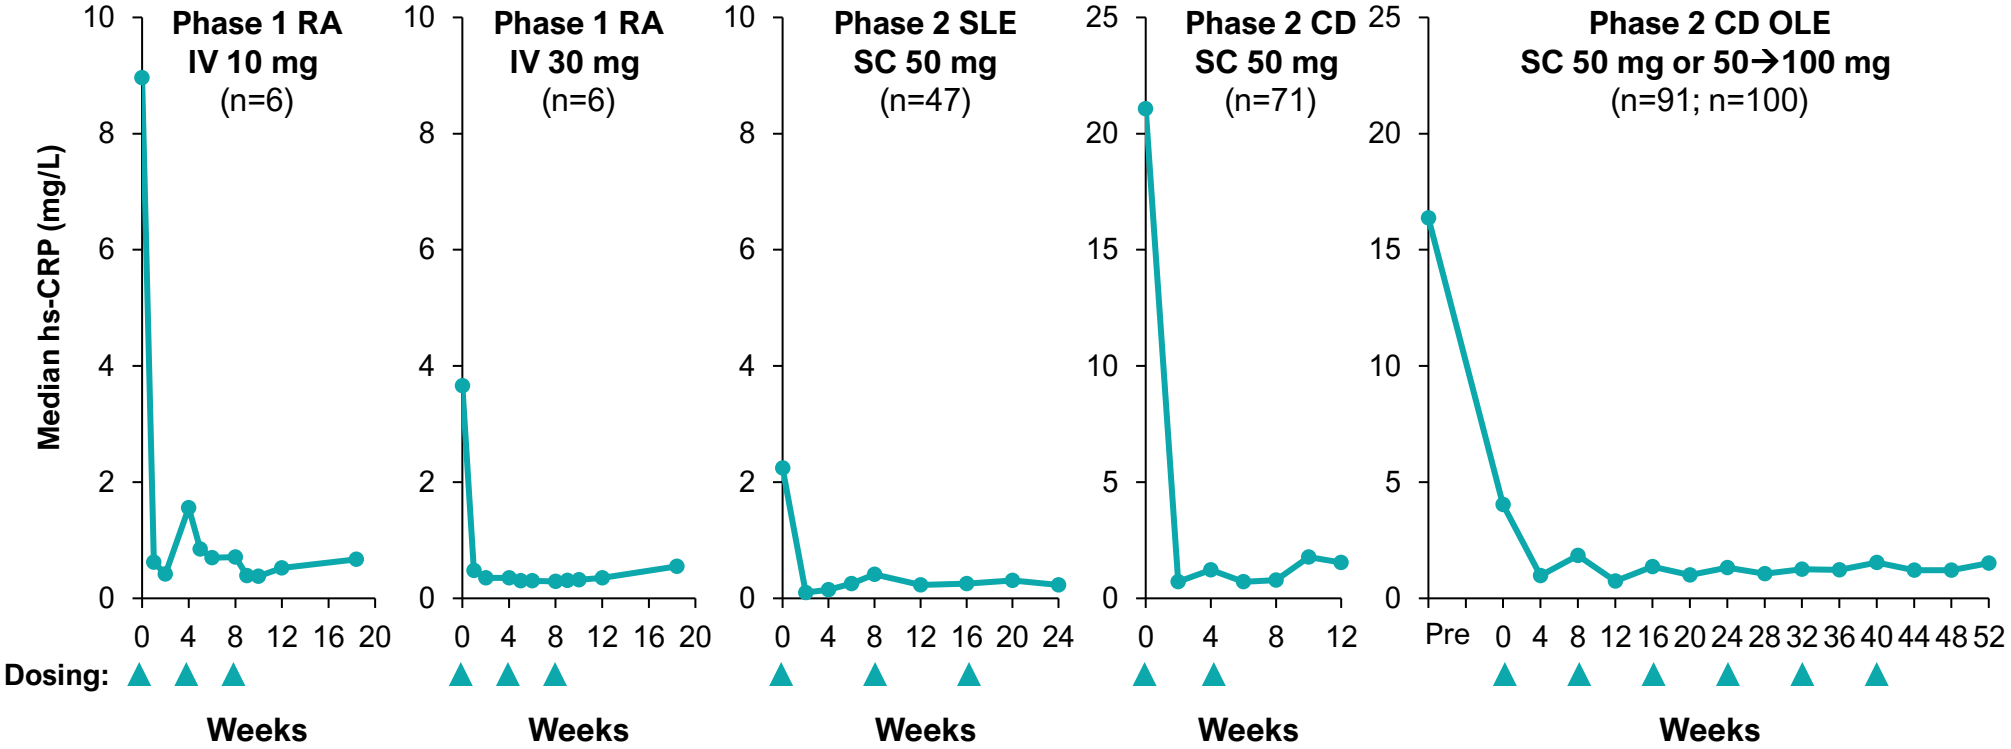
The timing of clinical trial milestones are subject to change.
ASCVD: atherosclerotic cardiovascular disease. CKD: chronic kidney disease. CVOT: cardiovascular outcome trial. ESKD: End Stage Kidney Disease. HFpEF: heart failure with preserved ejection fraction. MACE: major adverse cardiovascular event. MI: myocardial infarction.
[1]Clinicaltrials.gov: NCT05021835. [2]Clinicaltrials.gov: NCT06118281. [3]Clinicaltrials.gov: NCT06200207 [4]Clinicaltrials.gov: NCT05636176 [5]Clinicaltrials.gov: NCT05485961 (Phase 3 portion only)

Pacibekitug designed to offer best-in-class potential profile in cardiovascular diseases

	Pacibekitug	Ziltivekimab	Clazakizumab
Company	TOURMALINE	novo nordisk®	CSL
Monoclonal antibody	**fully human (IgG2)**	fully human (IgG1k, YTE mutation)	humanized rabbit (IgG1k)
Anti-drug antibodies[1]	**0-1%**	6-13%[3,4]	0-10%[7-9]
Route of administration[2]	**SC 0.6 mL**	SC[5,6] 1.0 mL	IV[10]
Longest dosing intervals in completed studies	**Q8W (SLE, CD)**	Q4W (NDD-CKD)[5,6]	Q4W[10] (HD-CKD)
Targeted dosing intervals	**Quarterly**	Monthly	Monthly

CD: Crohn's disease, CKD: chronic kidney disease, HD: hemodialysis, NDD: non-dialysis dependent, SLE: systemic lupus erythematosus. [1]Incidence of ADAs in repeat-dose studies calculated as reported per dosing arm. [2]Route of administration in planned or ongoing studies in patients with or at high-risk of ASCVD. [3]Clinicaltrials.gov NCT03926117. [4]Pergola et al., JASN (2021). [5]Ridker et al., Lancet (2021). [6]Wada et al., J Cardiol (2023). [7]Clinicaltrials.gov NCT01490450. [8]Clinicaltrials.gov NCT01545050. [9]Weinblatt et al., Arthritis Rheum (2015). [10]Clinicaltrials.gov NCT05485961.
Data reported in publications or on clinicaltrials.gov as detailed above. No head-to-head studies have been conducted between the mabs shown here, which have each been evaluated in different populations.

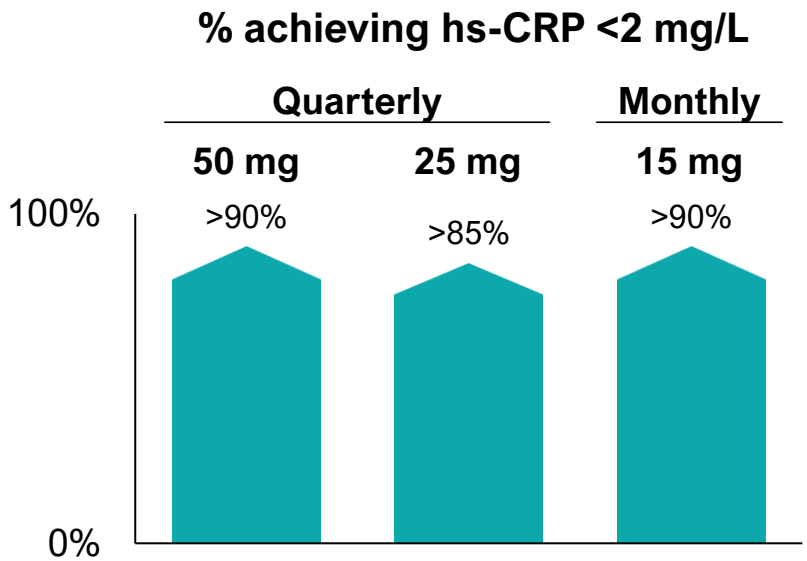
Pacibekitug achieved robust and durable suppression of CRP in patients with high-grade inflammatory autoimmune disorders

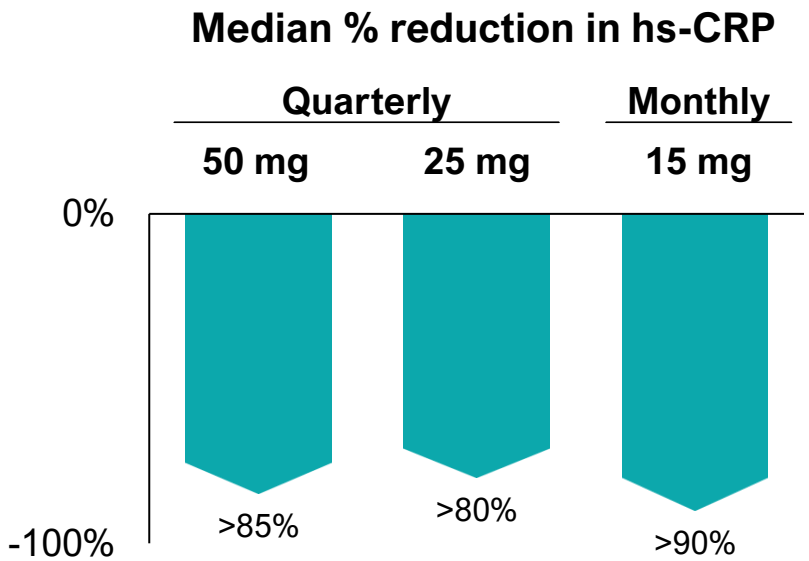


CD: Crohn's disease, OLE: open-label extension, RA: rheumatoid arthritis, SLE: systemic lupus erythematosus. Rheumatoid arthritis: B0151002 study report. Table 14.4.7.1.1. Median baseline CRP 9.0 mg/L. Key eligibility: active disease, background methotrexate. Crohn's disease: B0151003 study report. Table 14.2.4.1.3. Median baseline hs-CRP 21.1 mg/L. Key eligibility: active disease, failed/intolerant to anti-TNFα. CD OLE B0151005 study report. Table 14.2.4.1. Median pre-baseline hs-CRP 16.4 mg/L, baseline hs-CRP 4.0 mg/L. Systemic lupus erythematosus: B0151006 study report. Table 14.3.4.1.5. Median baseline hs-CRP 2.2 mg/L.

PK/PD modeling supports potential for quarterly dosing of pacibekitug SC in ASCVD

Results of PK/PD model developed from five studies in patients with RA, SLE, CD and healthy volunteers





Ziltivekimab 15 mg monthly[1]

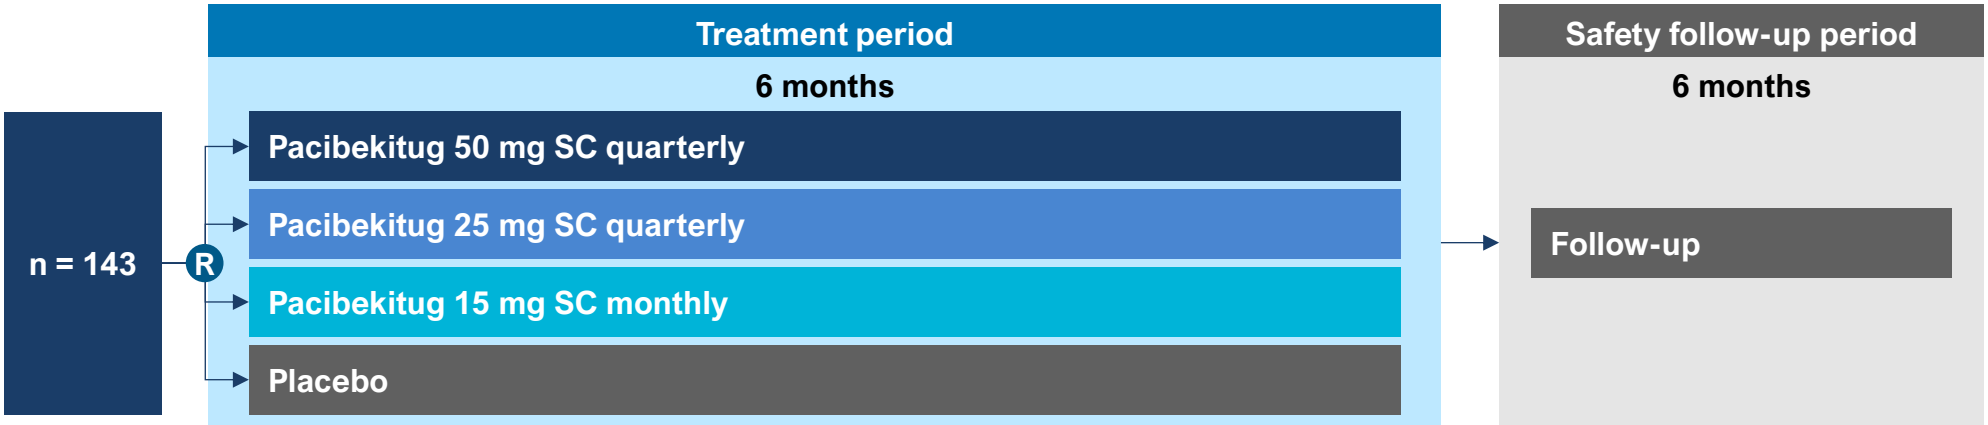
% achieving hs-CRP<2 mg/L: 82%

median % reduction: 88%

ASCVD: atherosclerotic cardiovascular disease, RA: rheumatoid arthritis, SLE: systemic lupus erythematosus, CD: Crohn's disease. The PK and PK/PD models for pacibekitug were developed based on the data from 5 clinical studies (two phase 1 studies in healthy volunteers, one phase 1 study in RA, one phase 2 study in SLE, and one phase 2 study in CD). A two-compartment model with first-order absorption and linear elimination and a mechanism-based indirect response model (in a relationship on CRP) adequately described the PK and PK/PD relationships, respectively. Simulations were performed assuming an RA-like population with baseline CRP >2 mg/L to 10 mg/L. Results at Day 90 are shown. [1]Ridker et al., Lancet (2021). Results after 12 weeks of treatment are shown. Certain data in this slide are based on a cross-trial comparison and are not based on head-to-head clinical trials. Cross-trial comparisons are inherently limited and may suggest misleading similarities or differences in outcomes. Results of head-to-head comparisons may differ significantly from those set forth herein.

TRANQUILITY Phase 2 trial supporting development in ASCVD

Double-blinded, placebo-controlled Phase 2 trial (NCT06362759) | Status: over-enrollment completed



Study population:

- CKD stage 3-4 (eGFR 15-59 ml/min/1.73m^2) or UPCR>200 mg/g
- hs-CRP ≥2 mg/L and <15 mg/L
- Exclude patients at higher risk for safety complications (e.g., immunocompromised patients)

Primary pharmacodynamic endpoint:

- Change from baseline in hs-CRP through Day 90

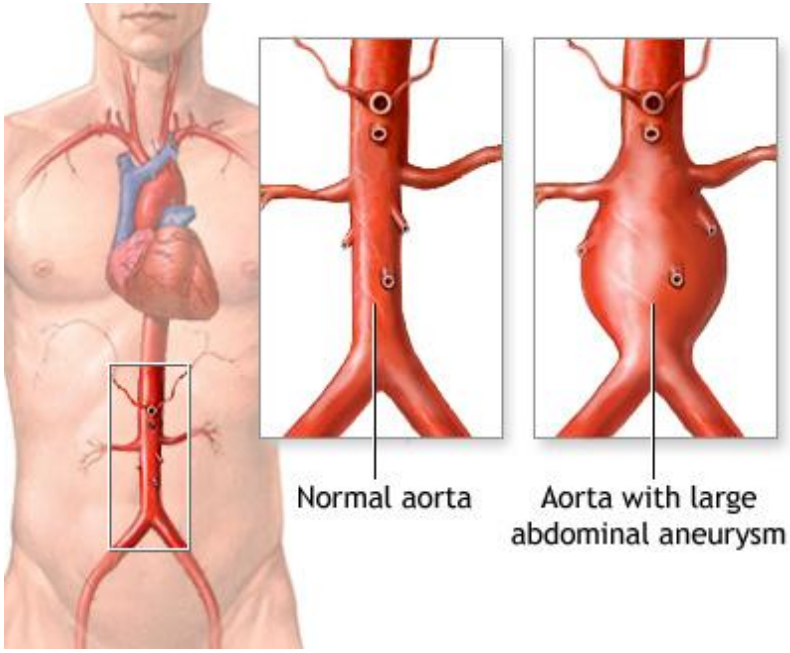
Additional endpoints:

- Percent of participants who achieve hs-CRP <2 mg/L
- Other pharmacodynamic markers, including lipoprotein (a)
- Safety and tolerability

ASCVD: atherosclerotic cardiovascular disease. CKD: chronic kidney disease. eGFR: estimated glomerular filtration rate. hs-CRP: high-sensitivity C-reactive protein. UPCR: urine protein-creatinine ratio.

Abdominal aortic aneurysm: a high-mortality, first-in-disease opportunity for pacibekitug

- High-risk vascular disease with **significant unmet need in approximately 2M people in US**[1]
- **Strong strategic fit** with ASCVD due to overlapping prescribers
- Progressive disease with increasing risk of **rupture, usually a fatal event**[2]
- **In less than 5 years**, majority of medium-sized AAA grow to threshold for surgical repair[3,4]
- Surgical repair, recommended for large AAA to prevent rupture, is **associated with complications**[5-9]



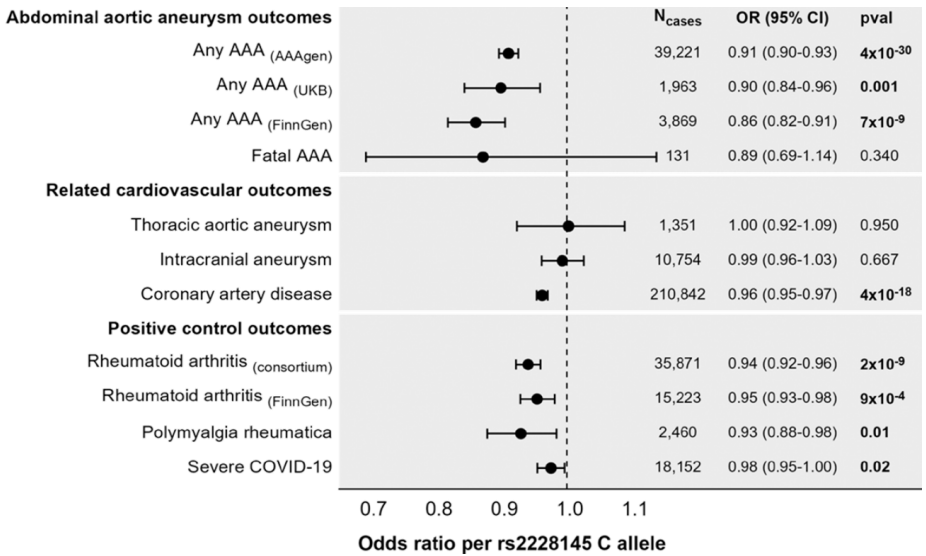
No FDA approved treatment

Figure from https://medlineplus.gov/ency/article/000162.htm.
AAA: abdominal aortic aneurysm. ASCVD: atherosclerotic cardiovascular disease. HCP: healthcare professional.

Compelling evidence supports IL-6 inhibition to slow AAA growth

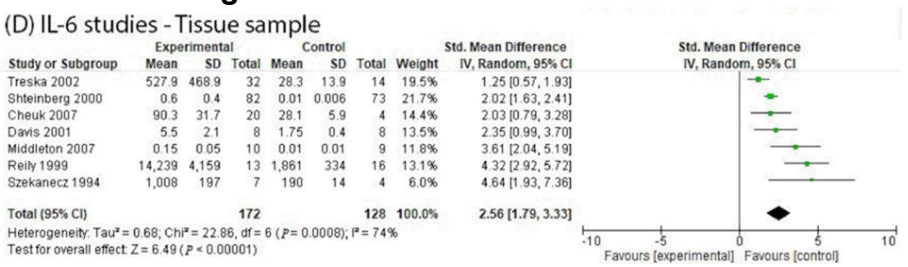
Human genetic evidence

Genetic variant associated with reduction in risk of AAA[1]

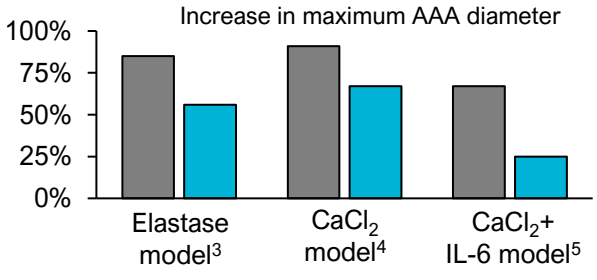


Epidemiological evidence

Higher IL-6 levels associated with AAA[2]



Experimental evidence



Inhibition of IL-6 pathway signaling decreased AAA expansion in multiple preclinical models[3]

[1]Burgess et al., Arterioscler Thromb Vasc Biol (2024). [2]Thanigaimani et al., Biomedicine (2022). [3]Kokje et al., Atherosclerosis (2016). Results at day 14. [4]Nishihara et al., PLoS One (2017). Results at day 42. [5]Patel et al., Vasc Endovascular Surg (2023). Results at day 21. AAA: abdominal aortic aneurysm.

Phase 2 PoC study expected to use imaging to evaluate the ability of pacibekitug to inhibit AAA growth

- Serial imaging is the foundation of clinical care[1]
- Phase 2 PoC expected to use multimodality imaging to efficiently characterize pacibekitug

Next steps:

- TRANQUILITY topline data in Q2 2025
- Alignment with FDA on Phase 2 PoC design
- Details to be shared prior to study start

CT

Thyroid Eye Disease

TED: our beachhead indication designed to validate pacibekitug's potential in autoantibody-driven diseases

1. **High unmet medical need with significant market opportunity**
   - TED patients experience significant disease burden driven by inflammation, proptosis, double-vision, and pain
   - ~30k new patients each year in the U.S. (average age at diagnosis is ~45)[1,2]
   - ~80%[3] of moderate-to-severe TED patients not receiving an FDA-approved treatment, which we believe may be related to significant limitations such as risk of permanent hearing impairment / loss:
     - Vast majority of US treaters report unmet need across all aspects of treatment (efficacy, safety, administration)[4]

2. **Extensive third-party clinical support that IL-6 inhibition may address key unmet needs**
   - 50+ publications with 400+ patients demonstrate the therapeutic potential of IL-6 pathway inhibition in TED
   - IL-6 may play a more central and upstream role in TED pathogenesis than IGF-1R or FcRn
   - Many TED treaters already routinely utilize IL-6 inhibition in their practice[4]

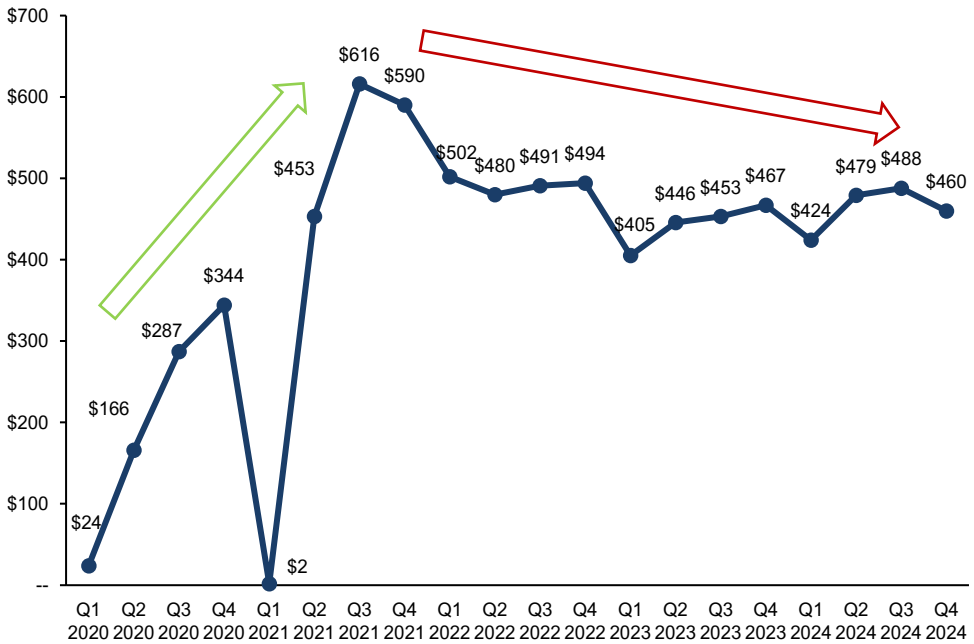
3. **Pacibekitug has best-in-disease potential in TED**
   - Deep inhibition of IL-6 pathway observed to date offers potential for durable efficacy across many endpoints
   - Existing clinical database supports the potential for a well-tolerated profile at selected doses
   - Q8W dosing would allow for a patient-friendly, low burden treatment course

[1]Lazarus, Best Pract. Res. Clin. Endocrinol. Metab. (2012). [2]Bartalena et al., Front. Endocrinol. (2020). [3]Horizon Q3 2022 earnings call. [4]Tourmaline market research.

IGF-1R class limitations present a significant opportunity for novel therapeutic approaches in TED

TEPEZZA U.S. revenues have been stagnating since 2021…

Sales ($M)[1]



…believed to be due to real-world experience

1. **Safety issues:** Risk of potentially permanent hearing loss[2]

> **----------WARNINGS AND PRECAUTIONS----------**
>
> - Hearing Impairment Including Hearing Loss: TEPEZZA may cause severe hearing impairment including hearing loss, which in some cases may be permanent. Assess patients' hearing before, during, and after treatment with TEPEZZA and consider the benefit-risk of treatment with patients

2. **Limited durability:** Growing real-world effectiveness data reveals larger than anticipated number of non-responders / high relapse rate[3,4]

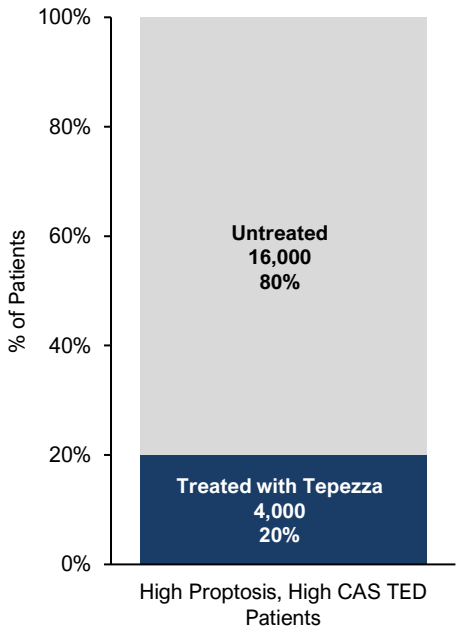
3. **High level of inconvenience & complexity:**
   - IV Q3W (n=8)[2] but limited access to infusion centers[5]
   - Numerous visits and high time commitment (HCPs and patients)[5]
   - Need for serial audiograms, as per label[2,6]
   - Burdensome reimbursement approval process[7]

[1]Horizon and Amgen company reports and filings. [2]TEPEZZA FDA label. [3]Kahaly et al., Thyroid (2021) (ATA 2021 presentation). [4]Rosenblatt et al., Ophthalmic Plast Reconstr Surg (2023). [5]Tourmaline market research. [6]Chow and Silkiss, BMJ Case Rep (2022). [7]Horizon Therapeutics Public Ltd. Co. Q2 2023 Form 10-Q.

Despite an FDA-approved medicine, the vast majority of moderate-to-severe TED patients remain untreated

Most TED patients are not receiving TEPEZZA…

TEPEZZA US LTM penetration[1]



…or only get it relatively late in the treatment journey[2]

Simplified Treatment Journey[2]

We believe many of these reports may underestimate the true efficacy of IL-6 inhibition

- 400+ mostly steroid-refractory patients
- Late IL-6 inhibition (>9 months post symptom onset) when disease may have exited active phase
- Exposure to IL-6 inhibition may have been suboptimal (<6 months)
- Tourmaline market research with over 100 TED treaters suggests many HCPs already routinely utilize IL-6 inhibition in their practice

TOURMALINE

Proptosis response rate is generally defined in the data outlined here as a ≥2 mm proptosis improvement in the worse eye at baseline without any worsening in the other eye. CAS response rate is generally defined in the data outlined here as a CAS of 0 or 1. Studies referenced in this table represent investigator-led studies and were not designed with the intent of generating evidence for an approval of tocilizumab or sarilumab in TED. The majority of these studies were not designed with power to detect statistical significance. Retro: retrospective. Obs: observational. Prosp: prospective. RCT: randomized controlled trial. CS: case series. CR: case report. NR: not reported. NS: not significant. CI: clear improvement. Tepro: teprotumumab. Publications available upon request

Pacibekitug's target product profile is expected to be well-differentiated in TED…

Target product profile in TED*

Study population		• Moderate-to-severe active TED patients
MOA		• **IL-6 inhibition**
Efficacy	Primary endpoint	• **Proptosis**
Efficacy	Secondary endpoints	• **Diplopia, clinical activity score (CAS), inflammation, and lid retraction**
Efficacy	Additional measures	• Lower **rate of relapse** and retreatment • **Rapid time to response** • Lower rate of **surgical intervention**
Safety	Warnings & precautions	• **No anticipated risk of permanent hearing loss** or warnings beyond typical IL-6 safety considerations
Dosing & administration		• **Every 8-week, low volume subcutaneous injection** through pre-filled syringe • Finite dosing

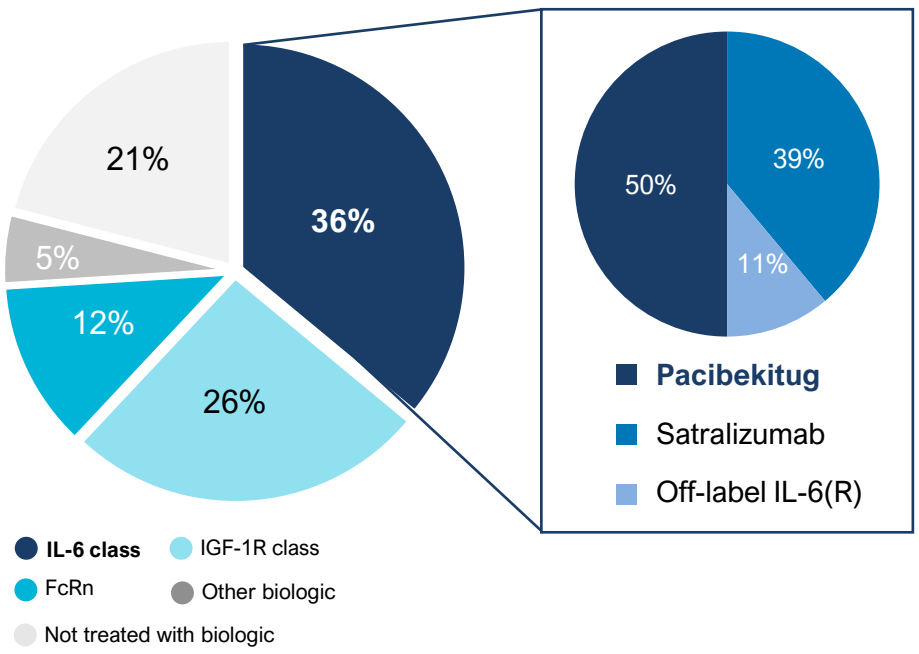
Targeted points of differentiation

- **Targeting inflammation** which is at core of disease
- **Holistic impact** on many QoL-impacting symptoms
- Emphasis on **response durability**
- **Well-tolerated** without the risk of hearing loss
- Least frequent and **most patient-friendly SC dosing**

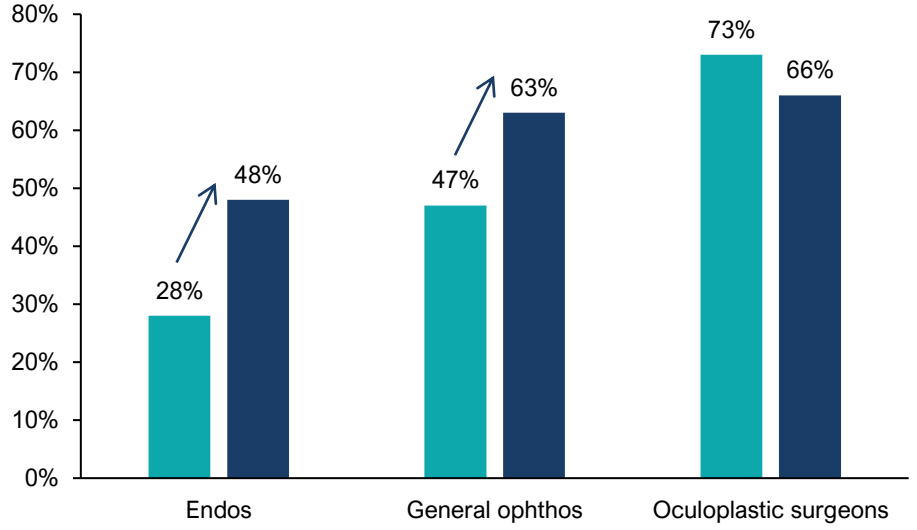
*This target product profile outlines the desired characteristics of pacibekitug in TED. It will be informed by clinical data from Phase 2b and Phase 3 and additional evidence generated from other programs including from the real world. The characteristics presented reflect outcomes that may not be representative of pacibekitug. The results of past clinical trials may not be indicative of future results, and the results of future or ongoing clinical trials may not demonstrate some or any of the characteristics presented.
MOA: mechanism of action. QoL: quality of life. TED: thyroid eye disease. SC: subcutaneous

…resulting in leading market share, capitalizing on increasing Rx from endocrinologists and ophthalmologists

Pacibekitug ranked highest in future market share among 140 TED treaters in US[1]



Impact on Rx if SC therapies are available[1]



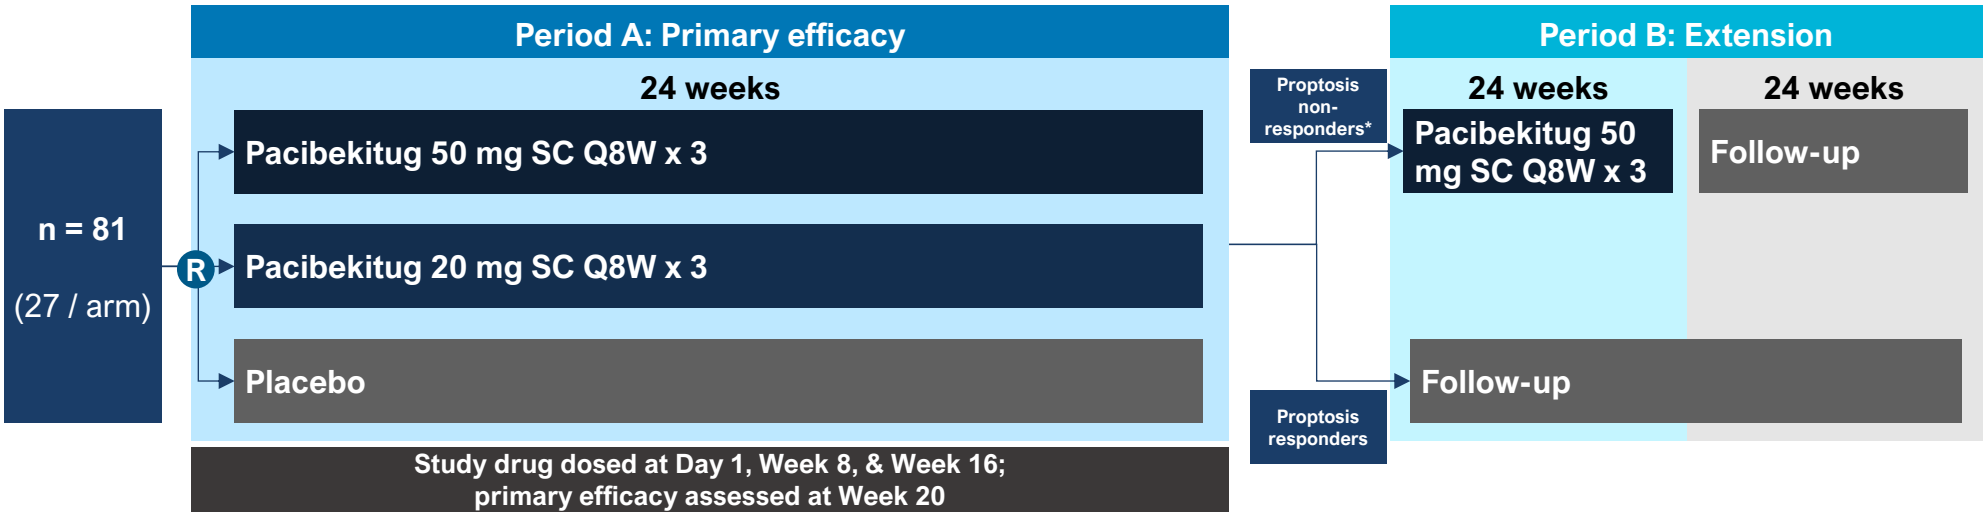
- I treat and manage moderate to severe active TED patients rather than referring out to another physician today
- As additional treatments become available for TED, including SC therapies, I will treat and manage moderate to severe active TED patients rather than referring out to another physician

[1]In a masked survey of future potential product entrants - HCP Quant Research with N = 60 General Ophthos, N = 40 Endos and N = 40 Oculoplastic Surgeons (February 2024). FcRn: neonatal fragment crystallizable receptor. IGF-1R: insulin-like growth factor 1 receptor. IL-6: interleukin-6. Rx: prescriptions. SC: subcutaneous. TED: thyroid eye disease.

spiriTED pivotal trial in first-line TED

Double-masked, placebo-controlled Phase 2b trial (NCT06088979)

Open label



Study population:
- Moderate-to-severe TED, with proptosis ≥ 3mm above normal (based on race and gender)
- Active phase, with symptom onset ≤ 15 months, CAS ≥ 4 and positive TSI
- First-line setting, with cap on prior corticosteroid use (< 1g methylprednisolone or equivalent)

Primary efficacy endpoint:
- Proptosis response rate at week 20

Additional endpoints:
- CAS
- Diplopia
- QoL, safety, PK/PD/ADA

*Any patient who receives rescue therapy/intervention in Period A will not receive pacibekitug in Period B and will instead undergo follow-up only

Key upcoming milestones

Disease focus	Indication	Milestone	Expected timing
Cardiovascular inflammation	ASCVD	TRANQUILITY Phase 2 topline data	Q2 2025
	AAA	Phase 2 trial start	Post-TRANQUILITY topline data
Autoimmune disease	TED	spiriTED Phase 2b topline data	H2 2025

AAA: abdominal aortic aneurysm. ASCVD: atherosclerotic cardiovascular disease. TED: thyroid eye disease.
